

Part F: Security Reflection:

1. What cybersecurity risks did you identify in your own digital habits?

During this cybersecurity assessment, I identified several risks in my own digital habits. One of the biggest issues is that I have occasionally reused passwords for multiple online accounts. This practice increases the risk of multiple accounts being compromised if one password is leaked. I also realized that I have not enabled Multi-Factor Authentication (MFA) on every account, which reduces the level of protection against unauthorized access. In addition, I sometimes click links in emails or messages without carefully checking whether they are genuine, making me more vulnerable to phishing attacks. I also do not review my account privacy settings or change my passwords regularly.

2. What security improvements will you implement immediately?

To improve my online security, I will immediately start using strong and unique passwords for every account and store them securely using a password manager. I will enable MFA on all important accounts, including my Google, LinkedIn, and other social media accounts. I will also keep my operating system, browser, and applications updated to protect against the latest security threats. Before opening links or downloading attachments, I will verify the sender and ensure the source is trustworthy. Additionally, I will regularly back up important files and monitor my account security settings.

3. Why is cybersecurity important in today's world?

Cybersecurity is essential in today's world because we rely on the internet for communication, education, banking, shopping, and work. Protecting personal information from cybercriminals helps prevent identity theft, financial loss, and privacy violations. By following good cybersecurity practices, individuals can stay safer online and reduce the chances of becoming victims of cyberattacks.
